

2014 Annual Drinking Water Quality Report

Newport Borough Water Authority

PWSID# 7500022

Este informe contiene información muy importante sobre su agua de beber. Tradúzcalo ó hable con alguien que lo entienda bien. (This report contains very important information about your drinking water. Translate it, or speak with someone who understands it.)

WATER SYSTEM INFORMATION:

This Annual Drinking Water Quality Report is designed to inform you about the water quality and services delivered to your tap daily by the Newport Borough Water Authority. Our commitment to providing a safe and dependable water supply, while improving our delivery with new distribution lines and state of the art processing, continues as our primary goal to you the customer.

Should you have questions concerning this report or the water system in general, please contact the Authority at (717) 567-6373, Monday through Friday, from 8:00 a.m. until 4:30 p.m. Regularly scheduled meetings are held at 7:00 p.m. on the first Monday of each month, at the Authority's office. The public is cordially invited to attend.

SOURCE(S) OF WATER:

Our water supply comes from a combination of four groundwater well sources and a river filtration plant. All water is disinfected by mandate from the Pennsylvania Department of Environmental Protection (PaDEP). Chlorination is used to insure bacteriological safety of all of our groundwater water supplies. Our Oliver Twp. treatment plant provides dual filtration, utilizing manganese greensand and granular activated carbon. Our Howe Twp. treatment plant utilizes double filtration by manganese greensand. Our river treatment plant draws water from the Juniata River and uses membrane technology to treat the water.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

MONITORING YOUR WATER:

We routinely monitor for various contaminants in your drinking water according to federal and state laws. The following tables show the results of our monitoring for the period of January 1 to December 31, 2014. The State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data is from prior years in accordance with the Safe Drinking Water Act. The date has been noted on the sampling results table.

DEFINITIONS AND ABBREVIATIONS:

Action Level (AL) - The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are

set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant that is allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Minimum Residual Disinfectant Level (MinRDL) – The minimum level of residual disinfectant required at the entry point to the distribution system.

Treatment Technique (TT) – A required process intended to reduce the level of a contaminant in drinking water.

ppb = parts per billion, or micrograms per liter ($\mu\text{g/L}$)

ppm = parts per million, or milligrams per liter (mg/L)

n/d = not detected at the analytical minimum detection limit.

HEALTH EFFECTS:

MCLs are set at very stringent levels. To understand the possible health effects described for many regulated contaminants, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

VIOLATIONS:

- There were four (4) violations in the 2014 monitoring period. The failure to and/or report distribution chlorine residual results during the monitoring period of March 2014; Total Coliform Presence in March and October 2014; and Volatile Organic Carbons in January 2014.
- The failure to deliver a copy of the 2013 CCR to the PaDEP in the prescribed time.

EDUCATIONAL INFORMATION:

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or human activity. Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater run-off, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater run-off and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater run-off and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to assure that tap water is safe to drink, EPA and DEP prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. FDA and DEP regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some

contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

Information about lead

Lead and copper were monitored during 2013, with results below the mandated Action Level. If present, elevated levels of lead and copper can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Newport Borough Water Authority is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

DETECTED SAMPLE RESULTS

Chemical Contaminant	MCL in CCR units	MCLG	Level Detected	Range of Detections	Units	Sample Date	Violation Y/N	Sources of Contamination
Arsenic	10	0	0	0.0-0.0	ppb	2013	N	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes
Barium	2	2	0.037	0.0-0.037	ppm	2014	N	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Chromium	100	100	0	0.0-0.0	ppb	2013	N	Discharge from steel and pulp mills; erosion of natural deposits.
Fluoride	2 ¹	2 ¹	0	0.0-0.0	ppm	2013	N	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Nitrate	10	10	2.6	n/d – 2.6	ppm	2014	N	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Haloacetic Acids (HAA)	60	N/A	46	n/d – 46	ppb	2014	N	By-product of drinking water disinfection
TTHMs (Total Trihalomethanes)	80	N/A	39	n/d – 39	ppb	2014	N	Runoff from herbicide used on row crops.
Combined Uranium	30	0	0	N/A	ppb	2013	N	Erosion of natural deposits

¹ EPA's MCL for fluoride is 4 ppm. However, Pennsylvania has set a lower MCL to better protect human health.

Contaminant	Action Level (AL)	MCLG	90 th Percentile Value	Units	# of Sites Above AL of Total Sites	Violation of TT Y/N	Sources of Contamination
Lead	15	0	4.5	ppb	0 out of 10	N	Corrosion of household plumbing systems; Erosion of natural deposits
Copper	1.3	1.3	0.803	ppm	0 out of 10	N	Corrosion of household plumbing systems; Erosion of natural deposits; Leaching from wood preservatives

Entry Point Disinfectant Residual Contaminant	MINIMUM DISINFECT RESIDUAL	LOWEST LEVEL DETECT	RANGE OF DETECTION	Units	Sample Date	Violation Y/N	Sources of Contamination
Chlorine	0.2	0.4	0.4-3.65	ppm	Jan-Dec	N	Chlorine residual is maintained in the system to maintain proper disinfection.

Microbiological Contaminant	MCL	MCLG	Highest # or % of Positive Samples	Violation Y/N	Sources of Contamination
Total Coliform Bacteria	For systems that collect <40 samples/month: More than 1 positive monthly sample	0	1 ²	N	Naturally present in the environment.

Fecal Coliform Bacteria or E. coli	0	0	1 ²	N	Human and animal fecal waste.
------------------------------------	---	---	----------------	---	-------------------------------

²Sample was contaminated during sampling, subsequent check samples were taken and no bacteria were present.

Turbidity Contaminant	MCL	MCLG	Level Detected	Sample Date	Violation Y/N	Sources of Contamination
Turbidity	TT = 1 NTU for a single measurement	0	0.77	1/14	N	Naturally present in the environment.
	TT = at least 95% of monthly samples \leq 0.3 NTU		99.3 %	12/14	N
